

SUMMARY

Experienced Data Scientist with diverse experience in building tree based models for tasks such as classification/regression and NLP models for tasks such as NER and sentence classification. I have worked extensively on tabular data and natural language for solving various machine learning problems.

EDUCATION

- **Indian Institute of Technology, Delhi** Delhi
B.Tech in Civil Engineering *June. 2014 - July. 2018*

ACHIEVEMENTS

- IIT JEE AIR 1867
- KVPY AIR 326

COURSES COMPLETED

Linear Algebra, Probability and Statistics, Calculus, Machine Learning, Deep Learning, Natural Language Processing, Data Structures and Algorithms

WORK EXPERIENCE

- **Naukri** Noida
Data Scientist *Feb 2022 - Present*
 - **Job Description Parser:** Built JD Parser on Naukri Jobs to extract skills and designation from job description with neural network based named entity recognition model. The NER model was trained on hand annotated data using thousands of job descriptions across Naukri ecosystem. Used BiLSTM Label Attention Network as architecture choice.
 - * Able to achieve 0.75+ F1 Score on annotated data.
 - **Job Department Prediction:** Developed department prediction model for Naukri Jobs using Job Designation, and Skills as input and Department as output. The problem was modelled as a Sentence Classification problem with 37 different departments as outputs. Used Label Specific Attention Network as architecture choice.
 - * Able to beat previous Naive Bayes Model from 66% accuracy to 80% accuracy using NN based approach.
 - **Job Seeker Skills Ranking:** Developed Skill Ranking Module for Naukri's Job Seekers. Hundreds of skills are first extracted from Job Seeker's CV and Profile and then ranked according to the Random Forest Model's probability predictions. To create training data, skills present in jobs for which user was shortlisted are labelled positive, otherwise negative. Features are created purely from user's profile e.g. skill relatedness to current designation and a binary classifier is trained.
 - * Able to improve AU-PRC from 45% in earlier model which used various rules and heuristics to 60% AU-PRC.
- **Paytm / Paytm Bank** Noida
Software Engineer (Data Science Department) *Dec 2018 - Feb 2022*
 - **Merchant Look-Alike Model:** Developed model to predict merchant like behaviour in Paytm's customer base in order to target them to onboard as merchants. Used transactional behaviour of customers to predict if they qualify for the characteristics only merchants exhibit. This was developed using Random Forest Model
 - **Merchant Churn Prediction Model:** Developed merchant churn prediction models for Paytm's merchants base based on past financial history of each merchant. Random Forest Model was used to train a binary classifier predicting churn probability.

SKILLS

Python, NLP, Neural Networks, Deep Learning, Decision Trees, Random Forest, Pytorch, SVD, PCA, Pyspark, CNN, RNN/LSTM/GRU, Attention Models, NER Models.
